IEEE INFOCOM 2026 Workshop on 6G AI-RAN

April 2026

Outline

- Introduction
- Results

Introduction

Motivation

- First key point about the radio access network (RAN).
- Second key point with more detail.
  - Supporting sub-point.
- Third point, with an alerted phrase.

Fira Sans Light is the body default; three weights sit between it and bold.

- **Regular** — one step up from the body.
- **Medium** — two steps up.
- **SemiBold** — one notch under **bold**.

A URL is body text: https://github.com.

Where this leaves us

The RAN intelligent controller (RIC) decides in milliseconds what the network takes minutes to measure.

System Overview

Left column

Describe the first component here.

Right column

Describe the second component here.

Blocks

Definition

Formal definition or theorem.

Key Result

The main contribution or takeaway.

Example

A concrete illustrative example.

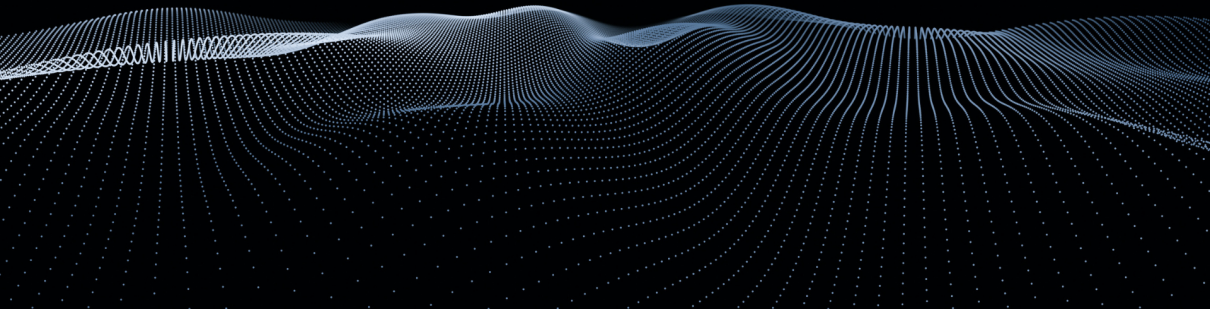

An empty title drops the title bar: a body-only callout.

Narrow

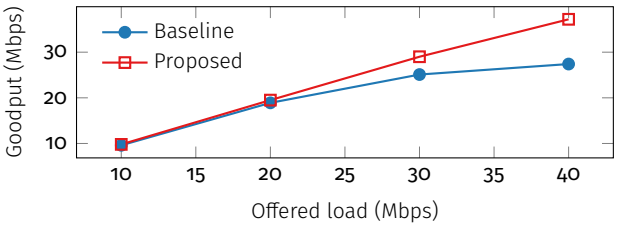

Sized from `\textwidth`

A `narrow` minipage resets `\textwidth`, so blocks, figures, and tables inside it shrink to match.

Results

Throughput

Goodput against offered load, averaged over ten runs.

The baseline saturates at 30 Mbps; the proposed scheme does not.

Results

Method	Metric A	Metric B
Baseline	12.3	45.6
Proposed	**10.1**	**50.2**

Metric A drops by 18% while Metric B gains 10%.

Scheduler

Algorithm 1: Greedy slice assignment

Input: Slice demands $d_1, \ldots, d_n$; capacity C
Output: Assignment a

```
1 Sort slices by descending d_i;
2 foreach slice i do
3     if d_i ≤ C then
4         a_i ← d_i;
5         C ← C − d_i;
6 return a;
```
